The history of modern contact angle and wetting can be traced back to the seminal paper by Thomas Young,"An Essay on the Cohesion of Fluids," published in 1805. However, the first paper on the subject was written by Galileo Galilei in 1612 when he wrote "Bodies that Stay Atop of Water, or Move in It.". Interest in wettability is far-reaching as it plays an extremely important role in many areas of human endeavor, ranging from high-tech (microelectronics, micro- and nanofluidics, MEMS ...

The surface wettability is an important property related to the surface free energy and the geometric structures (Cassie and Baxter, 1944; Wenzel, 1936). Generally, a surface with a water contact angle (CA) larger than 90° is called a hydrophobic surface, while the surface is called superhydrophobic if the water CA is larger than 150°.

Wettability - an overview | ScienceDirect Topics

The contact angle is the angle, conventionally measured through the liquid, where a liquid – vapor interface meets a solid surface. It quantifies the wettability of a solid surface by a liquid via the Young equation. A given system of solid, liquid, and vapor at a given temperature and pressure has a unique equilibrium contact angle.
