M. Thaddeus: Columbia University, New York, NY. Algebraic Geometry has been at the center of much of mathematics for hundreds of years. It is not an easy field to break into, despite its humble beginnings in the study of circles, ellipses, hyperbolas, and parabolas. This text consists of a series of exercises, plus some background information and explanations, starting with conics and ending with sheaves and cohomology.

Algebraic geometry is a branch of mathematics, classically studying zeros of multivariate polynomials. Modern algebraic geometry is based on the use of abstract algebraic techniques, mainly from commutative algebra, for solving geometrical problems about these sets of zeros. The fundamental objects of study in algebraic geometry are algebraic varieties, which are geometric manifestations of solutions of systems of polynomial equations. Examples of the most studied classes of algebraic varieties

The main idea is to factor $x^2 + 4x - 12$. Since $-12 = -2 \times 6$ and $-2 + 6 = 4$. $x^2 + 4x - 12 = (x - 2)(x + 6)$ Since the length is usually longer, length = $x + 6$ and width = $x - 2$. Example #9: A must know how when solving algebra word problems. The area
